Interface Configuration

Terminology

Extensible Authentication Protocol (EAP)

A flexible authentication framework defined in RFC 3748

EAP Over LANs (EAPOL)

EAP encapsulated by 802.1X for transport across LANs

Supplicant

The device (client) attached to an access link that requests authentication by the authenticator

Authenticator

The device that controls the status of a link; typically a wired switch or wireless access point

Authentication Server

A backend server which authenticates the credentials provided by supplicants (for example, a RADIUS server)

Guest VLAN

Fallback VLAN for clients not 802.1X-capable

Restricted VLAN

Fallback VLAN for clients which fail authentication
